

Loan Recovery Suite: Operations & Propensity Engine

Author: Gram99

Target Stakeholders: Recovery Strategy, Collections Operations, & Chief Risk Officers (CRO)

Executive Summary

This interactive decisioning platform is designed to optimize the Net Present Value (NPV) of delinquent loan portfolios. By bridging the gap between raw borrower data and recovery operations, the engine provides a data-driven framework to solve the "Cure" selection dilemma: identifying exactly when to litigate an account internally versus when to execute a bulk asset sale.

Key Business Impact:

- **Yield Optimization:** Replaces "one-size-fits-all" collections with an NPV crossover model, ensuring high-propensity accounts are retained for internal recovery while low-yield assets are offloaded.
- **Risk-Adjusted Prioritization:** Leverages a Logistic Regression engine to score Propensity to Pay (PTP), allowing recovery teams to focus resources on the highest-probability targets.
- **Operational Transparency:** Features a "Human-in-the-Loop" architecture using Streamlit's `st.data_editor`, allowing managers to override system recommendations while maintaining a 100% compliant audit trail.

Executive UX & Strategic Modules

The application is built for speed and precision, designed for immediate review by senior operations leads.

Module 1: Strategic Recovery Lab (NPV Crossover)

- **Goal:** Determine the financial "break-even" point for internal legal efforts.
- **Precision Modeling:** Incorporates **WACC (Cost of Capital)** and **Recovery Horizons** to discount future cash flows back to the present, comparing them directly against immediate third-party sale bids.
- **Sensitivity Analysis:** Visualizes how shifting discount rates impact the "Hold vs. Sell" decision.

Module 2: Propensity Engine (PTP & Segmentation)

- **Goal:** Segment the portfolio by behavioral and financial risk.
- **Predictive Scoring:** Uses a **Logistic Regression model** to weight Income, Days Past Due (DPD), and Balance into a singular 0–100 Propensity score.
- **Risk Matrix:** Maps Probability of Default (PD) against Loss Given Default (LGD) to categorize account health into actionable quadrants.

Module 3: Geospatial Risk & Compliance

- **Goal:** Identify regional clusters and legal friction points.
- **Mapping:** Integrates `pgeocode` for lightweight US Zip Code mapping, highlighting state-specific risks (e.g., high-difficulty litigation environments in NY or CA).

Technical Implementation

This project demonstrates proficiency in financial engineering, predictive modeling, and interactive full-stack deployment.

- **Languages:** Python 3.x
- **Data Science:** Pandas (ETL), NumPy (NPV Modeling), Scikit-Learn (Logistic Regression).

- **Geospatial:** pgeocode (Postal mapping).
- **UI/UX:** Streamlit (Application framework), Plotly Express (Dynamic visualization).

Installation & Usage

To launch the decision engine locally:

1. **Clone the repository:** `git clone https://github.com/your-username/loan-recovery-suite.git`
2. **Install dependencies:** `pip install -r requirements.txt`
3. **Run the app:** `streamlit run app.py`

Repository Strategy

This repository serves as a **Narrative of Authority**, demonstrating that sophisticated 2nd-line risk strategies can only be effective when they are seamlessly integrated into 1st-line operational workflows.
